The background of the slide is a dark, abstract image featuring a multitude of thin, parallel lines of light. These lines, in shades of blue, purple, and white, radiate from a central point at the top, creating a sense of depth and movement, similar to light trails from a long-exposure photograph of a starry sky or a high-speed camera shot of a light source.

## Weighting

# Weighting approach and data reliability assessment

All the data has been post-stratified so that the samples are representative of the relevant country population with respect to:

- (i) gender crossed by age group, and
- (ii) gender crossed by degree-holding status (among 25-64 year olds).

Gender and age statistics were sourced from the US Census Bureau\* and education statistics from the OECD\*\*

Weighted and unweighted sample distributions for each country are shown on the following pages.

The country-level survey percentages quoted in this report have a standard margin of error\*\*\* of plus or minus three to four percentage points. However, analysts should be avoid drawing firm inferences from small between-country differences in results.

\*<https://www.census.gov/data-tools/demo/idb/region.php?N=%20Results%20&T=15&A=separate&RT=0&Y=2020&R=-1&C=CA,FR,GM,IT,JA,UK,US> was used as the search term.

\*\*<https://www.oecd.org/education/education-at-a-glance/educationataglance2019-dataandmethodology.htm> indicator A1, tables A1.1 and A1.2. Note that the age 25-34 male:female tertiary education ratio in table A1.2 has been used as a proxy for the male:female degree-holding ratio for the age range 25-64.

\*\*\*The 'standard margin of error' is equivalent to the 95% confidence interval conditional on the sample being treated as a random sample from the population. An online panel sample is not a random sample but is weighted to reflect the demographic profile expected from a random sample and will usually have a similar 'random error' risk. The standard margin of error may be interpreted as a 5% risk that the true population value lies outside of the stated range (conditional on the sample assumptions outlined above).
